ABSTRACT

Background: Despite many reports of clinical outcomes in patients undergoing high-risk percutaneous coronary intervention (HRPCI) with hemodynamically support, little is known about whether this approach improves left ventricular ejection fraction (LVEF). The purpose of the present observational study was to evaluate, in an ideal patient population with heavily supported HRPCI, whether there is an impact on left ventricular function at mid-term follow-up.

Methods: RESTORE EF is a multicenter, retrospective analysis of a prospectively collected observational data set that aimed to assess 90-day LVEF in patients undergoing heavily supported HRPCI (ACC/AHA/ACC, who received with an intervening cardiac procedure prior to the primary endpoint follow-up relative [90-day LVEF assessment]). Secondary endpoints included change in New York Heart Association Functional Classification and Canadian Cardiovascular Society Angina Grade at the last follow-up.

Results: From August 2019 to May 2021, 466 patients were enrolled at 23 US sites. Age was 70.2 ± 11.4 years; 26% were female. In paired assessments at 90-day follow-up, baseline LVEF improved from 36 ± 13% to 46 ± 13% (P < .001), with significantly greater improvement in patients with medical SYNTAXII score ≥ 3. Percentage classified as New York Heart Association class II/IV decreased from 62% at baseline to 15% at last follow-up (P < .001), and percentage with Canadian Cardiovascular Society grade III/IV symptoms decreased from 72% to 26% (P < .001).

Conclusions: In an ideal cohort of HRPCI patients, there is a signal that hemodynamically supported HRPCI allows significant improvement in 90-day LVEF, with complete revascularization associated with greater LVEF improvement. These hypothesis-generating findings merit further assessment in large, all-comer studies and randomized trials.

REVIVED

Follow-up period:
Mean ± SD = 120 ± 40 days
Median (q1 q3) = 108 [89 149] days

Let's Look at the Populations

REVIVED

Age	70
Angina Class	
None	66%
CCS III	2%
EF	27%
NYHA >3	23%
CAD	
Left Main	14%
3VD	38%

STICH/ES

Age	60
Angina Class	
None	37%
CCS III	4%
EF	28%
NYHA >3	34%
CAD	
Left Main	3%
3VD	62%

RESTORE

Age	70
Angina Class	
None	10%
CCS III	69%
EF	37%
NYHA >3	60%
CAD	
Left Main	45%
3VD	38%

STICH/ES (NEJM 2011/16):

- 1212 pts ~ **60 M**>>F, CCS II and LVEF 28%.
- Median F/U 9.8 yrs.
- ACEi/ARB, and 50% MRA.
- Death rates at 4 yrs:
 - CABG ~28%
 - **Rx 32%**
- Higher rate of mortality in the medical therapy arm.

REVIVED BCIS 2 (NEJM 22):

- 700 pts ~ **70 M**>>F, CCS 0 and LVEF of 27%.
- Median F/U 3.5 yrs.
- + ARNI (37%)
- Death rates at 4 yrs:
 - MV PCI ~28 %
 - **Rx 26%**
- Lower rate of mortality in the Medical therapy arm.
